PREFACE.

In committing this indispensible work, the result of considerable time of untiring study, I feel confident that its importance cannot be over estimated, as it will supply a long felt and serious want.

The Creamery business, though comparatively of short existence is here to stay, but has been one of insuperable obstacles, and an instrument that will remove or prevent dificulties, cannot fail to interest all parties concerned.

By following the directions and indications of this chart, a number of serious difficulties may be avoided, and perfect satisfaction rendered to all parties interested.

LEVI D. MECKLEY.

INTRODUCTION.

THE branch of the Creamery Business this work is intended to regulate in the future, is the dividing of the butter, which it will do to the best of satisfaction in all cases; it will give every one having an interest in a lot of cream his share of it and no more, no matter what the circumstances are. The farmers, the cream gatherers, and the proprietor of the creamery are all treated alike. Any amount of cream may be put together, no matter what the different qualities are, or what number of cream gatherers put it there, or how many customers each one has, or how much better one lot of cream is than the other, or how much certain farmers or certain cream gatherers may try to defraud one another, or their employers by returning more inches, or making sample vials better than they should be. This chart will always correct them, and the person who uses it is never afraid he is not doing the fair thing with each and every one of his patrons and at the same time knowing he is under no obligation of paying for more than he actually gets.

The possessor of this chart can handle the creamery business with pleasure; he can at all times afford to pay the highest price for cream; he has no loss in weight, and knows at all times how to make his calculations hold out.

A Creamery turning out 300 lbs. of Butter per day losing one per cent. in weight, or 1 lb. out of every 100 lbs. will make a loss of 3 lbs. a day, or 1095 lbs in a year at 30 cents per pound would make a loss of $328.50; now, this is counting a loss of one per cent. while there are numerous creameries losing 5 per cent. and over, in fact I have known them to lose from 10 to 20 per cent. at times.

EXPLANATION TO STATEMENT.

FOR EXAMPLE SEE OPPOSITE PAGE.

Put each drivers cream in a vessel 18 inches in diameter. Measure with long rule to find number of inches and tenths. Mix cream thoroughly with Agitator, fill a vial out of each can, and test same as each farmers sample; put the bulk of the cream together and churn; weigh the butter, divide same among the drivers as you will afterwards divide each drivers share to his customers as per sample-test he brings in. In order to do this see example on opposite page. Driver No 1 had 42 inches of cream according to your measure; his measure shows 44 inches, but now we go according to your measure; sample test shows 22½ per cent. Now we go to table marked tenths on the following page; take column marked 40 at top, run down to 22½ in the percentage column which we find at the extreme left hand; result is 900 tenths. Then go to column marked 2 at top, run down to 22½ which gives 45 tenths plus 900 equals 945 tenths. Driver No. 2 brought in 2 cans of cream; can No. 1 contained 40 inches at 20 per cent. and can No. 2 contained 49 inches at 22 per cent.; now we find 40 inches at 20 per cent. equals 800 tenths; 49 inches at 22 per cent. equals 1078, plus 800 equals 1778 tenths for driver No. 2. Driver No. 3 brought 3 cans which equaled 2961 tenths; 2961, plus 1878 plus 945 equals 5784 tenths; this is divided by the number of pounds of butter which the bulk of this cream has made which is 240 lbs; this shows that it requires 24.1 per cent. of this lot of cream to make 1 pound of butter, hence we look to page 24.1 per cent. to divide this lot of butter among the different drivers by finding the inches at the top and the percentage at the left-hand column. This gives 39.2 lbs. to driver No. 1; 77.9 lbs. to driver No. 2, and 123 lbs. to driver No. 3. The same process is used to divide each drivers amount of butter among his customers. No. 1 is divided on page 24.7 per cent. also No. 2, but No. 3 runs a little better and is divided on page 22.0 per cent. For finding the result of tenths of inches take the same column as for inches and cut off right hand figure; for instance the result is 5.2 lbs. call it only 5 lbs. If it is 5.7 lbs. call it 6 lbs. If it is 5.5 lbs. call it only 5 lbs. If it is 5.6 lbs. call it 6 lbs. 12.2 lbs. call it 1.2 lbs. 12.6 lbs. call it 1.3 lbs. etc.

Now, by looking over this statement we find slight variations; these are fractional parts of tenths and may fall as often on one side as on the other, while the entire chart is calculated on this plan when it does not make over ½ of a tenth it is not counted at all, and when it makes over ½ of a tenth it is counted as one tenth. In the present statement we start with 240 lbs. and end with 240 lbs.
